

## SPECIFICATION SHEET

# Estimating

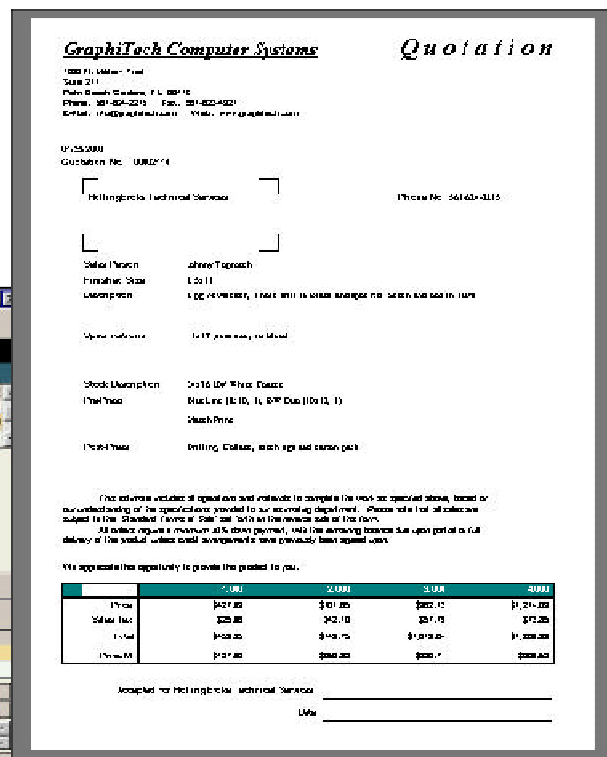

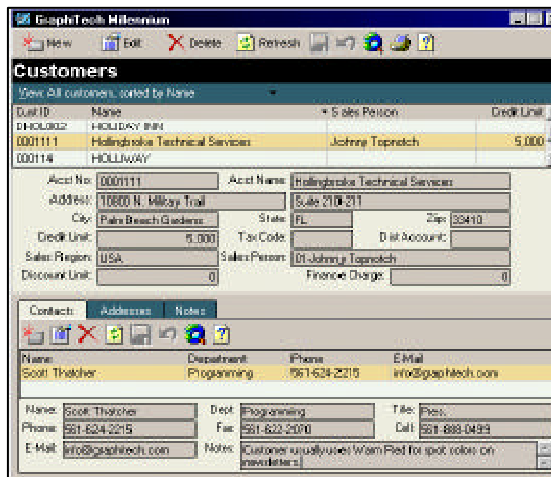

GraphiTech's new Millennium Estimator provides the power and flexibility needed in today's complex printing environment. From front counter Order Entry, to full scale Commercial Estimating to Fax-on-Demand bids, you have more sophistication available now than was even dreamed of just a few years ago. And with the ability to modify speed and

spoilage rates for every quote (or use the default values as shown), you get accurate estimates each and every time. In the illustration above, the Press Input area is shown. Note that each department contains a large "notes" section that prints with the Work Order shown on the back. To the right is the detail grid of running waste for the press. Below and to the right is an example of one of the Bid Forms available (the optional bid package contains up to 4 additional bid designs). You also may use your own logo or simply elect to use the text input for your header. Bids may be printed, faxed or sent by mail to your customer. At the bottom of the bid is a signature area for the customer to pen their acceptance of the quote.

The illustration at the bottom left identifies the customer input screen. Note the large amounts of data available for each customer, including cell phone, fax, email and web addresses for multiple contacts as well as numerous "Ship To" locations.

Price/1000:	\$427.89	\$353.82	\$320.71	\$303.00

This page illustrates some of the screens that comprise the Millennium Estimator. To the left is 1 of 4 detailed time and cost breakout sheets that enable you to accurately determine if all costs and times have been accounted for in a given quote. Item B identifies the bindery operations for this job. Note that you may specify very sophisticated detail in each bindery function. Item C provides an overview of the job plus allows access to Work Order, Bids, etc.

The Work Order to the left is 8.5x14 and provides detailed text for each department as well as an extensive listing of items pertaining to the job. Bar codes are used with the Data Collection System.

Item E to the right illustrates the Press Input file. In addition to the use of numerous speed and spoilage algorithms, a separate plate file shown above is employed that provides setup times for Work & Turn, Remounting, and Original Mounting of plates.
